

ODMAP Agency Administrators can create county-level Spike Alerts to notify them of overdose spikes based on the near real-time data being submitted to ODMAP. A county is determined to be in a "spike" if the total number of suspected overdoses meets or exceeds a pre-determined threshold within a rolling 24-hour period. Thresholds are calculated by ODMAP using the previous rolling 90-days of historical data submitted within a county. Agency Administrators can also set their own thresholds in the system. In addition to setting up Spike Alerts, Agency Administrators will also be responsible for managing the subscriber list.

Spike Alerts can be created for any county across the country. Establishing alerts for nearby counties provides agencies an opportunity to create an early warning system to increase preparedness for mobilizing resources to address spikes in near real-time.

Setting up a Spike Alert

To set up a Spike Alert, log in to ODMAP and then click on the "Manage" tab in the toolbar. Next, click "Alerts" in the drop-down and fill out the form to create each alert.

Custom messaging is also available to include in the Spike Alert emails. Individuals included in the subscriber list do not need to be ODMAP users, however, they do need to be part of a spike response and have a "need to know" as determined by the Agency Administrator.

Please see our [Spike Alert tutorial](#) on YouTube

Spike Alert Caveats

There are a few caveats to the Spike Alert feature:

- When a new data set is added, a county may see an increase in the number of alerts being sent out as the system is updating its recommended threshold.
- The threshold can automatically change based on incoming data, however, the system does not alert you if the threshold has changed.
- Due to the timing of overdoses being entered, it may appear that a Spike Alert ends right after the alert notification first is sent.
